Bareos 16.2.7 (maintenance version) published

2017-10-12 17:00

The new Bareos 16.2 maintenance version contains improvements and bugfixes. [Subscription](#) customers can find installation packages for Windows and all supported Linux distributions in their repositories. The source code is, as always, available on [GitHub](#).

The update provides performance improvements, especially for environments with a large number of directories, through an adjustment made to the `.bvfs_lsdirs` command. On Windows, an issue with the silent upgrade option the installer (`winbareos-*.exe /S`) has been fixed.

The release contains several more bugfixes and enhancements, for example:

- Fixes a Director crash that occurred on certain configurations when enabling debugging output
- Utilize OpenSSL ≥ 1.1 if available on the distribution used
- Windows: restore attributes also on directories (not only on files)
- Packages for openSUSE Leap 42.3 and Fedora 26 have been added

You can find the master ticket in our bug tracker for 16.2.7 here: <https://bugs.bareos.org/view.php?id=836>. Further details can also be found in the [release notes](#).
