

How can I export all tapes involved in a particular backup job?

In case that you want to put all tapes from a particular backup job to some other place (for redundancy or security reasons), you can now easily do this with a runscript within the job definition:

```
RunScript {  
  Console = "export storage=my_storage_name volume=%V"  
  RunsWhen = After  
  RunsOnClient = no  
}
```

You have to replace `my_storage_name` with the name of your configured storage, of course. All involved tapes of that job will automatically be moved to the export slot of your tape exchanger.
