Bareos 16.2.6 (maintenance version) published

2017-06-27 13:18

The new Bareos 16.2 maintenance version contains improvements and bugfixes. [Subscription](#) customers can find installation packages for Windows and all supported Linux distributions in their repositories. The source code is, as always, available on [GitHub](#).

The improvements include the option to state a [LAN address](#) for storages, through which the backup clients can connect to the storage. For the first time, also, packages for Debian 9 and Univention Corporate Server 4.2 have been published.

The update also contains bugfixes in regard to the use of multiple storage daemons and problems with the parameters for the `.bvfs` command.

You can find the master ticket in our bug tracker for 16.2.6 here: <https://bugs.bareos.org/view.php?id=794>. Further details can also be found in the [release notes](#).

We encourage all users running production environments to update their Bareos installations.
