Linux Bare Metal Restore with REAR and Bareos

2013-09-24 14:22

Bare Metal Restore tool REAR 1.15 supports Bareos as backend

[Relax-and-Recover](#) is a GNU/Linux system administrator tool used to create disaster recovery images which makes bare metal restore easier. System administrators use Relax-and-Recover as part of a disaster recovery policy which complements a good backup policy.

REAR creates an individual boot image for each machine. This image contains all relevant information to automatically boot and fully configure a minimal Linux system. Having accomplished this task, REAR uses a backup backend to restore the machine's data. With the new [release 1.15.0](#) REAR supports Bareos as backend.

The REAR project was founded by Dag Wieërs, Schlomo Schapiro and Gratien D'haese. Gratien presents the new REAR Release on the [Open Source Backup Conference 2013](#).
